Abstract:

Background: The size and composition of the group are the most basic elements of social organization in herding ungulates. The aim of this study was to investigate the herd composition of waterbuck *Kobus ellipsiprymnus defassa* "Katambour" in Dinder National Park.

Methods: Direct observation method was used to estimate the herd size and composition, the study was conducted in February, March, April and May 2018-2019.

Results: The results of herd composition revealed the effect of independent variables (year, meadows, month and time) on the dependent variable (herd composition) showed statistically significant differences where all P-values were less than 0.0001. *Defassa* waterbuck herd did not exist in Beit-alwahash meadows during the study period.

Comment: Three solitary males were seen in different meadows. A lonely female with very young calf (about one week or less of age) was seen in Abdel-Gani meadow. A bachelor herd of about 17-21 males was seen in Ras-amir meadow in March 2018. Nursery herd exist commonly in Abdel-Gani and Ein-alshamis meadow. Three predations were recorded. Further studies of *Defassa* waterbuck in different seasons with emphasis on the effect of war in their numbers, composition and distribution are needed.

Introduction

The group size and group composition are the major element of social organization in the ungulate population [1, 2].

Waterbuck is a sexually dimorphic antelope; males are taller as well as heavier than females. Females have two nipples but lack the pre-orbital glands, foot glands and inguinal glands are absent [3,4]. The hair is coarse, and they have a mane on their necks, the lower part of the legs is black with white rings above the hooves. Only male have horns [5 - 8], which are curved forward and vary in length from 55 99 cm. Body color ranges from gray to red-brown and darkens with age. Their head and body length ranges from 177-235 cm and shoulder height from 120-136 cm. The pelage is coarse [7,8].

Large mammals' population are strongly structured [9, 10], accordingly additional demographic indicators, such as sex ratios, group composition and recruitment rates, are often used to monitor populations [11- 13]. Herd composition counts are commonly used to estimate sex ratios, fawn/100 female ratios and fawn's recruitment in deer populations [14-16].

The herd composition of ungulates and other social mammals is affected by many factors which play important roles in shaping the group size. These are environmental factors, predation risk and reproductive strategies [17, 18]. One of the main benefits of group living is reduced predation risk through increased vigilance [17,19–21]. These studies also emphasize that effective species management within fenced areas requires an understanding of group size and seasonal variations.

Three social groups of bovidae family were distinguished, nursery/breeding herds comprising females with or without calves, bachelor herds (all males), and solitary adult males [22]. Defassa waterbucks form small herds of 6-12 individuals and larger herds of up to 30 individuals [7]. During dry seasons the herd fragment seeking adequate forage [23]. The social groups can be clearly noticed during foraging, migration and other daily activities [24]. The aim of this study is to the herd composition investigate waterbuck Kobus ellipsiprymnus defassa "Katambour" in Dinder National Park (DNP), Sudan.

Material and methods:

Study was carried out in DNP, which is located in the Blue Nile State bordering the Ethiopia country and it is surrounded by three States (Sinnar, Gadarif and Blue Nile) (Figure 1).

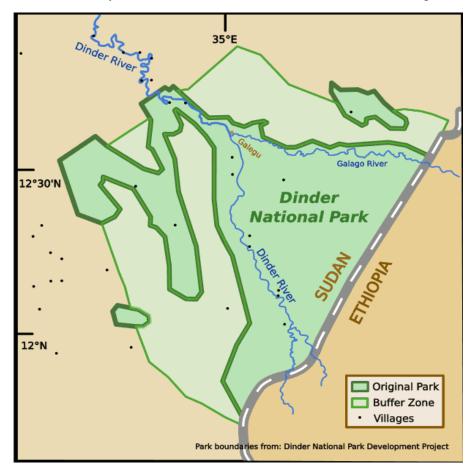

Figure 1: Location of Dinder National Park. **Source:** https://en.Wikipedia.org/wiki/Dinder_National_ParkResults (2020)

Observation covered herd types, structure and organization in the five meadows namely (Abdelgani N 12.61037 E 35.02751, Ein-el-Shams N 12.64413 E 35.00760, Ras Amir N 12.61553 E 35. 08929, Gererisa N 12 36 272 E 35 01 277 and Beit-alwahish N 12.50576 E 35.03881). Field surveys were executed during the dry seasons February, March, April and May 2018 and 2019. Recording started from 6 AM to 6 PM using binoculars (Deluxe 10 X 50). *Acacia nilotica*, *ziziphus spinachristi* and other large trees were used as a hide to avoid unduly disturbances. The herd composition monitoring covers 4 months February, March, April and May in 2018 and also

in 2019. The day was divided to period's morning (6:00 to 11:59 am), afternoon (12:00 to 2:59 pm) and evening (3:00 to 5:59 pm).

Results:

Table (I) showed the number of males, females, young and calves recorded during February, March, April and May. The highest number of males recorded was in April 27, followed by March, May and February 14, 10 and 9 respectively. The highest number of females recorded was in April 155 followed by 67, 64 and 54, March, May and February respectively. The highest number of young recorded was in April 51, followed by 33, 26 and 10 February, March and May respectively. The highest number of calves recorded was in April 18, followed by 17 in February, 14 in March and 7 in May.

Table (1) Number and average of herd composition seen at the five sites (2018)

Months	Herd composition	Number	Mean	Standard deviation
February	Male	9	0.375	0.924
	Female	54	2.25	1.225
	Young	33	1.38	0.88
	Calves	17	0.71	1.00
March	Male	14	0.58	0.78
	Female	67	2.79	0.98
	Young	26	1.08	1.44
	Calves	14	0.58	0.83
April	Male	27	1.125	0.54
	Female	155	6.58	1.56
	Young	51	2.13	2.21
	Calves	18	0.75	0.68
May	Male	10	0.417	0.50
	Female	64	2.67	1.56
	Young	10	0.417	0.72
	Calves	7	0.29	0.62

Table (2) showed the number of males, females, young and calves recorded during February, March, April and May. The highest number of males recorded was in April which was 42, followed by March, February and May 15, 12 and 6 respectively. The highest number of females recorded was in April which was 267 followed by 94, 79 and 53, February, March and May respectively. The highest number of young recorded was in April which was 11, followed by 9, 6 and 4 February,

March and May respectively. The highest number of calves recorded was in April which was 21, followed by 9 in March, 8 in May and 4 in February.

Table (2): Number and average of herd composition seen at the five sites (2019)

Months	Herd composition	Number	Average	Standard deviation	
February	Male	10	0.5	0.830	
	Female	94	3.92	3.092	
	Young	9	0.375	1.056	
	Calves	4	0.167	0.565	
March	Male	15	0.625	1.135	
	Female	79	3.29	4.639	
	Young	6	0.25	0.737	
	Calves	9	0.375	1.279	
April	Male	42	1.75	2.436	
	Female	267	11.13	12.188	
	Young	11	0.46	1.318	
	Calves	21	0.875	1.624	
May	Male	6	3.125	0.737	
	Female	53	20.55	5.666	
	Young	4	1.252	0.816	
	Calves	8	1.747	0.917	

Fig 3: Female with calf less than two week's age in Abdelgani Meadow

ANOVA test:

The effected of independent variables (year, meadows, month and time) on dependent variable (herd composition) was statistically significant where all P-values less than 0.05 (Table, 3).

Table (3): ANOVA for impact of independent variables on dependent variable (herd composition)

Variables	Sum of square	DF	Mean square	F	P. value
Year	359.125	1	359.125	52.521	0.000
Meadow	1387.492	4	346.873	50.529	0.000
Month	101.387	3	33.796	12.708	0.000
Time	8012.725	11	728.430	106.530	0.000

Fig 3: A herd of waterbucks; males can be distinguished by their long horns whereas females have none.

Discussion:

There was a variation in herd composition and size in the two years of the study, where (P-value 0.000). This result is consistent with a study conducted in southern India [24], which reported that many mammal species form social groups during various activities such as foraging, migration, and other daily behaviors. Similarly, a study from Sri Lanka [1] highlighted that factors such as group size and composition influence the social organization of herding ungulates.

There was a variation in herd composition in the **meadows**, where (P-value 0.000) (Table 3) this is because Abdel-Gani has greater amounts of forage biomass (biomass was estimated) and has water for most of the dry season, This result is consistent with the findings of Roberts et al. [17] and Bon et al. [18], who reported that predation risk and reproductive strategies reported to be key factors in description, formation and shaping of social organization of ungulates and group size and many other factors. Bachelor herd was recorded in Ras-amir, while the nursery

herd was not common in it. This may be due to the presence of pastoralists and fishermen, so all these factors disturb the herd of *defassa* waterbuck and drive their occurrence to use more safety meadow.

There were statically significant differences of the herd composition and size in months. This result is consistent with studies on territorial and mating behavior in large antelopes [25–27]. They found that many factors play roles in the great variation in mammalian sex ratio within and among species. These factors are attributed to competition among males for females and predation. This result also agrees with Peterson [28], who found that differences in life history and reproductive strategies among ungulates often cause males and females to form separate groups, leading to distinct patterns of habitat use known as 'social segregation'.

There was a statistical significant different in herd composition of *defassa* waterbuck during the **day time** P-value less than 0.05. That is may due to strategies of the different herds in utilizing the meadows, herds start entering meadows before 6:00 am and as the day goes on more herds join the other feeding herds. The nursing herds with calves stay in the meadow, while males leave. The bachelor herds wander along the park. I noticed a

group of 5-7 males sometimes coming at 10-11 am drinking and the then leaving the Abdel-Gani meadow, in April 2019.

Conclusion:

Three solitary males were seen, one in Rasamir meadow N 12 61 553 E 35 08929, one in Abdel-Gani meadow N 12. 61 037 E 35 02 751 and third one in Idres Abdelbagi road N 12 38 515 E 34 59 048. Lonely female with very young calf (about one week or less of age) was seen in February 2018 at Abdel-Gani meadow.

Bachelor herd of about 17-21 males were seen in Ras-amir meadow in March 2018. Nursery herd exist commonly in Abdel-Gani and Ein-alshamis meadow. Three predations were recorded, one female in Ein-alshamis, one male in Abdel-Gani and the third on near Ras-amir meadow.

Recommendations:

Further studies of *Defassa* waterbuck in different seasons with emphasis on the effect of war in their numbers, composition and distribution.

Acknowledgment:

I greatly appreciate the cooperation and assistance provided by all staff members on Galago camp for their supports during the period of research. Also I'm grateful to wildlife research Center, Zoology Department, University of Khartoum and College of Animal Production, Sudan University of Science and Technology for their support.
